Let μ and ν be two probability measures.

For $\varepsilon \in \mathbb{R}_+$:

$$(\mathcal{P}_\varepsilon) : \min_{\pi \in \Pi(\mu, \nu)} \int c(x, y) d\pi(x, y) + \varepsilon \text{KL}(\pi \mid \mu \otimes \nu)$$

with :

$$\text{KL}(\pi \mid \xi) = \int_{\mathcal{X} \times \mathcal{X}} \log \left(\frac{d\pi}{d\xi}(x, y) \right) d\pi(x, y)$$

Generative Adversial Networks (GAN)

Figure: GAN architecture

- Adversial Training :
 - Discriminator is trained to classify correctly fake and real data
 - Generator is trained to make the discriminator classify generated data as real data

FashionMNIST	GSink_ ₁	GSink_ ₁₀	GSink_ ₁₀₀	GAN
OT distance	49	63	75	82
Inception score	6.8	7.7	7.5	8.3

Table: Quantitative results of generative models learned with Sinkhorn loss with ε (GSink_ ε) and the GAN on the FashionMNIST dataset.

Sinkhorn based models achieve :

- Similar performance to GAN
- Better geometric properties

Further works :

- Confirm the results of the Inception Score and try to understand them better
- Validity of our conclusions for larger datasets?

Kantorovitch formulation of OT

For μ and ν two probability measures on \mathcal{X} :

$$(\mathcal{P}) : \min_{\pi \in \Pi(\mu, \nu)} \int_{\mathcal{X} \times \mathcal{X}} c(x, y) d\pi(x, y)$$

with the set of admissible couplings :

$$\Pi(\mu, \nu) \stackrel{\text{def.}}{=} \{ \pi \in \mathcal{M}_+^1(\mathcal{X} \times \mathcal{X}); P_{1\#}\pi = \mu, P_{2\#}\pi = \nu \}$$

Sinkhorn loss between μ and ν

By noting $\mathcal{W}_{c,\varepsilon}(\mu, \nu)$ the value of $(\mathcal{P}_\varepsilon)$ for μ and ν :

$$\overline{\mathcal{W}}_{c,\varepsilon}(\mu, \nu) = 2\mathcal{W}_{c,\varepsilon}(\mu, \nu) - \mathcal{W}_{c,\varepsilon}(\mu, \mu) - \mathcal{W}_{c,\varepsilon}(\nu, \nu)$$
